

## Questions

### Project Scope & Target Audience

- Is our solution limited to these specific cases (PG&E, SCE, SDGE) or is it intended as a general solution for similar legal proceedings?
- Will this be a tailor-made consulting solution exclusively for these companies, or can it evolve into a repeatable offering?
- Basically do we fine tune the LLM only on these cases?

### Document Handling & Data Flow

- In the case proceedings, there are Request documents—are these the questions the LLM is expected to answer?
- Do users upload their own case documents directly for analysis, or is data ingestion managed via an existing system?

### Data Management, Confidentiality & User Base

- Are these documents confidential, and what are the implications for data security and compliance?
- What is the anticipated number of users, and how will that impact system scalability?

### Response Evaluation & Consistency

- How do we evaluate the quality of the LLM's responses? (Which metrics or benchmarks should be used?)
- What does “consistency with historical responses” mean in this context, and how will we measure it?

### Search

- Should we offer an advanced search similar to [JSTOR](#) ?

### Frontend

- Would the data from the data visualization aspect be drawn from search results? What sort of data are we wanting to visualize and where do we want the user to see it?
